How scientists use GO

Prudence Mutowo UniProt-GOA

Belo Horizonte September 2014

How scientists use the GO

- Access gene product functional information
- Analyse high-throughput genomic or proteomic datasets
- Validation of experimental techniques
- Get a broad overview of a proteome
- Obtain functional information for novel gene products

Some examples...

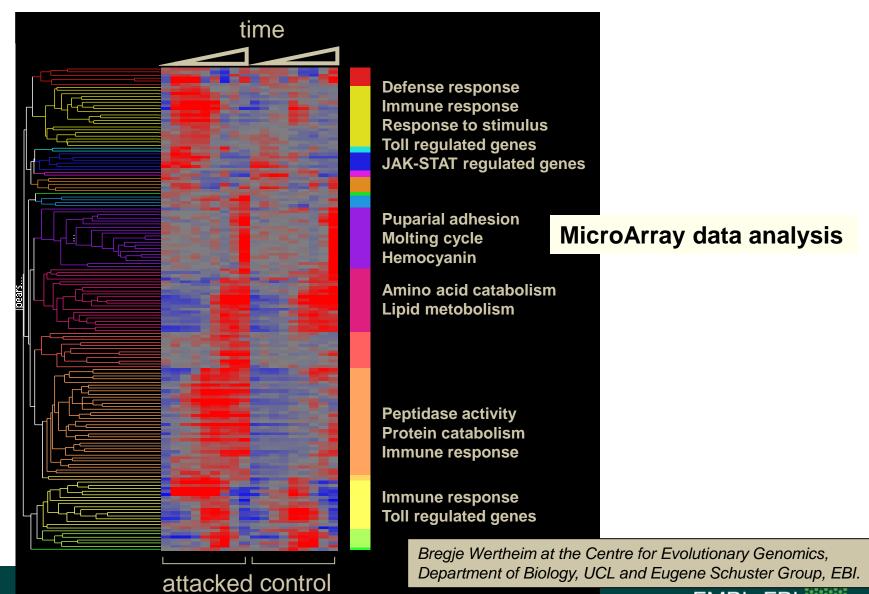

Term enrichment

- Most popular type of GO analysis
- Determines which GO terms are more often associated with a specified list of genes/proteins compared with a control list or rest of genome
- Many tools available to do this analysis
- User must decide which is best for their analysis

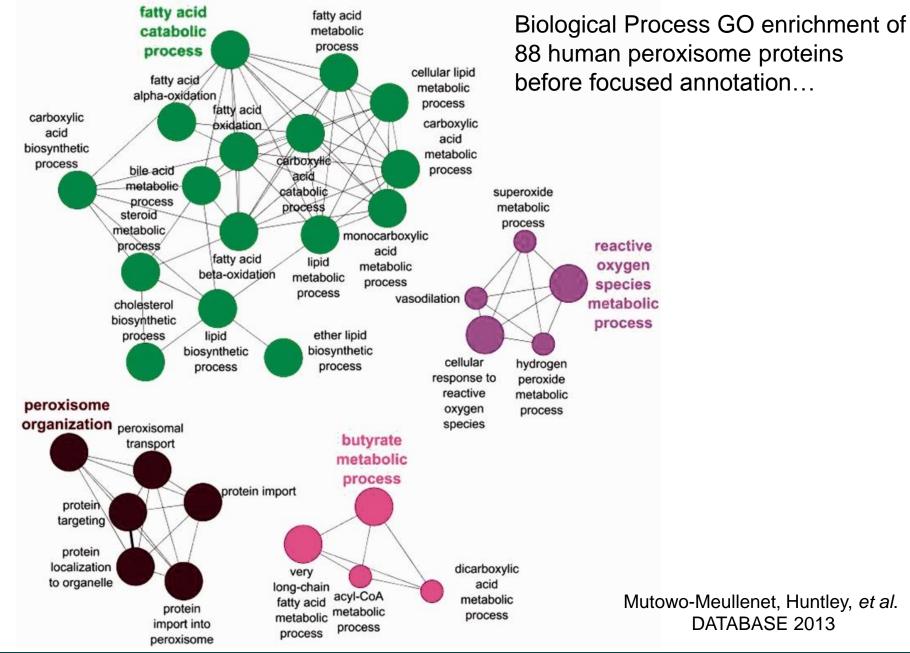

Analysis of high-throughput genomic datasets

Analysis using GO annotations

Many more listed at:

http://neurolex.org/wiki/Category:Resource:Gene_Ontology_Tools

Annotating novel sequences

• Can use BLAST queries to find similar sequences with GO annotation which can be transferred to the new sequence

• Two tools currently available;

AmiGO BLAST – searches the GO Consortium database

BLAST2GO – searches the NCBI database

Annotating novel sequences

 Can use InterProScan to find GO annotation that is attributed to protein signatures in a submitted protein sequence

STEP 3 - Submit your job

Using the GO to provide a functional overview for a large dataset

 Many GO analysis tools use GO slims to give a broad overview of the dataset

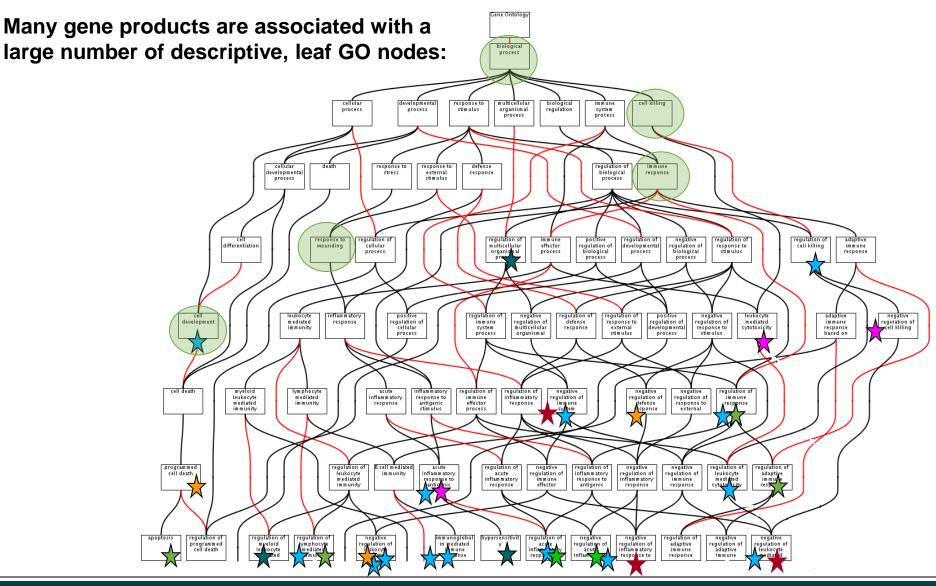

• GO slims are cut-down versions of the GO and contain a subset of the terms in the whole GO

• GO slims usually contain less-specialised GO terms

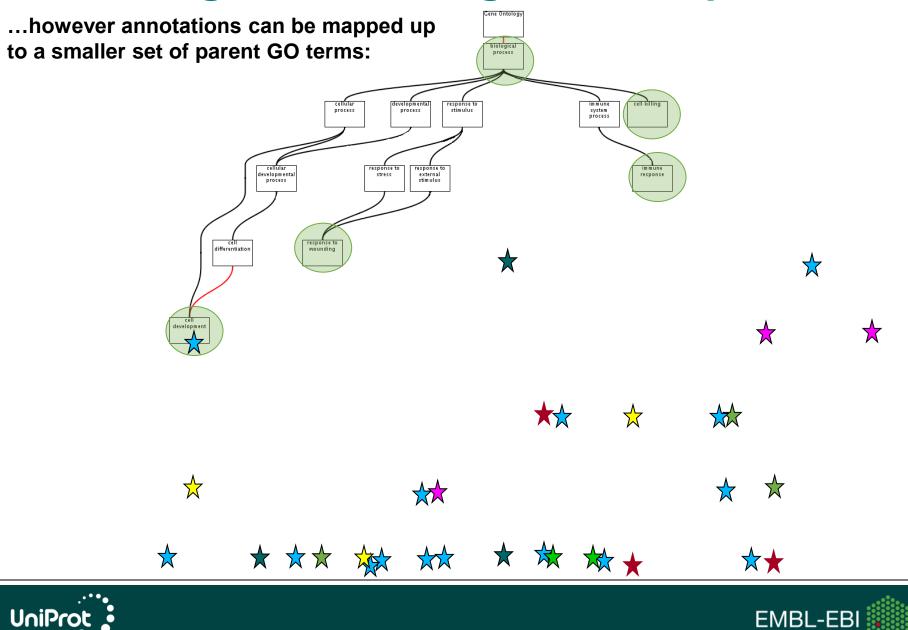

Slimming the GO using the 'true path rule'

Slimming the GO using the 'true path rule'

GO slims

Custom slims are available for download;

http://www.geneontology.org/GO.slims.shtml

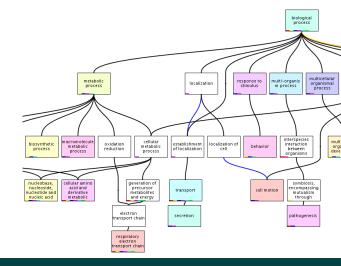

or you can make your own using;

QuickGO

http://www.ebi.ac.uk/QuickGO

• AmiGO's GO slimmer

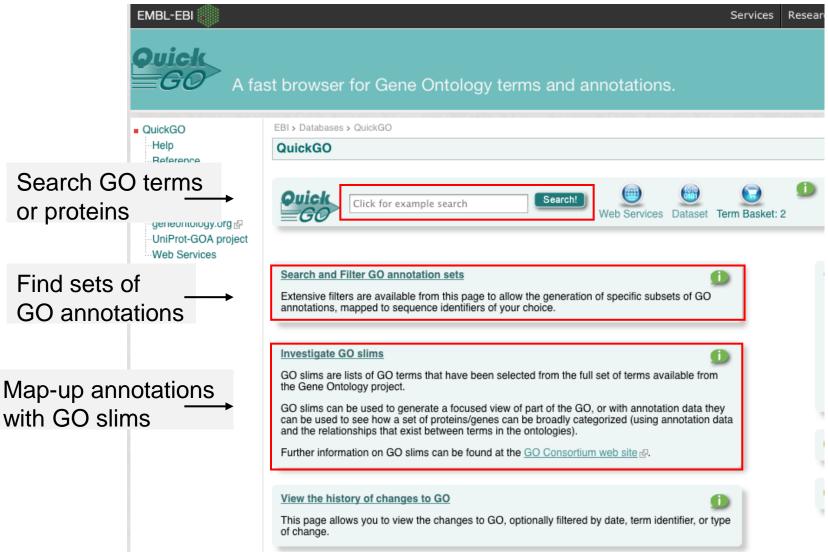

http://amigo.geneontology.org/cgi-bin/amigo/slimmer

The EBI's QuickGO browser

Using GO slims in QuickGO Exercise 1 (pg.27)

Find protein list at:

ftp://ftp.ebi.ac.uk/pub/contrib/goa/Tutorial_Data

Precautions when using GO annotations for analysis

- The Gene Ontology is always changing and GO annotations are continually being created
 - always use a current version of both
 - if publishing your analyses please report the versions/dates you used

http://www.geneontology.org/GO.cite.shtml

- Recommended that 'NOT' annotations are removed before analysis
 - only ~7000 out of 141 million annotations are 'NOT'
 - can confuse the analysis

Precautions when using GO annotations for analysis

• Unannotated is **not** unknown

- where there is no evidence in the literature for a process, function or location the gene product is annotated to the appropriate ontology's root node with an 'ND' evidence code (no biological data), thereby distinguishing between unannotated and unknown

• Pay attention to under-represented GO terms

- a strong under-representation of a pathway may mean that normal functioning of that pathway is necessary for the given condition
